

Plastic BioSand Water Filter

A simple technology that provides clean, safe, drinking water at a rate of .75 liters-per-minute. A single unit provides enough drinking and bathing water for an average family of 7 each day.

For only \$60.00 you can change the life of a family in a developing country.

- **70% of people from these counties lack access to treated water. These bio sand filters can help stop illness caused by waterborne disease caused by drinking, cooking and bathing in polluted water.**
